MR SULLY UNFOLDS PHYSICS

Speed, velocity and distance–time graphs

AQA 4.5.6.1
Forces · Paper 2
Foundation & Higher

Name _____ Class _____ Date _____

Speed tells you how fast something is moving. Velocity also tells you which direction. Distance–time graphs show motion at a glance.

KEY IDEAS

- Speed = distance ÷ time (s = vt). Typical speeds: walking 1.5 m/s, running 3 m/s, cycling 6 m/s; sound in air 330 m/s.
- **Distance** and **speed** are scalars. **Displacement** and **velocity** are vectors (they include direction).
- On a distance–time graph, the **gradient** is the speed. A horizontal line means stationary.

Section A · Recall and calculate

Grade 4–5

1 What is the difference between speed and velocity? [1]

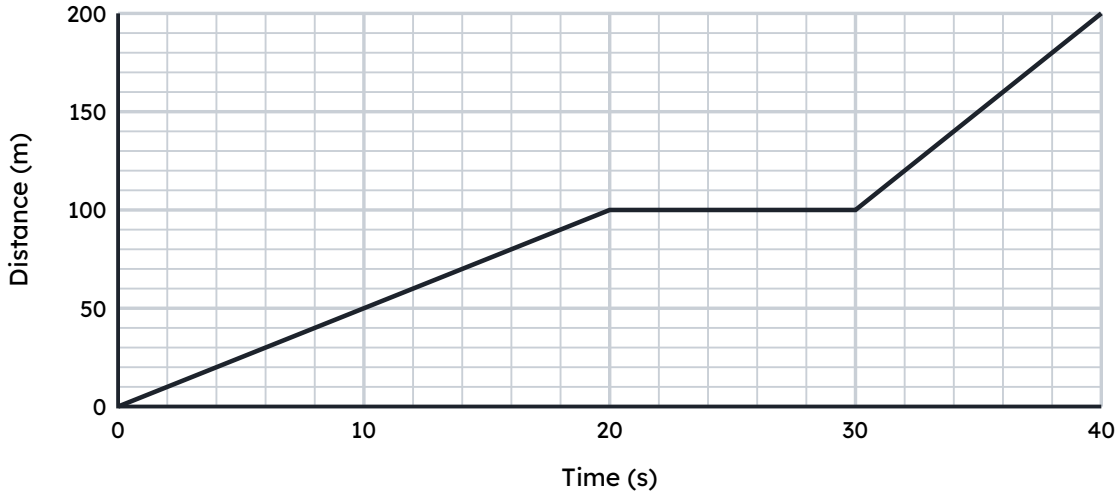

2 A cyclist travels 1800 m in 300 s. Calculate her average speed. [2]

3 Give a typical speed for a person walking. [1]

Section B · Read the graph

Grade 5–6

4 The distance–time graph shows a student's walk.

a Describe the motion between 20 s and 30 s. [1]

b Calculate the speed in the first 20 s. [2]

c State when the student was moving fastest. Explain how you can tell. [2]

Section C · Stretch

Grade 7+

5 A car travels 6 km in 5 minutes. Calculate its average speed in m/s. [3]

6 Explain why a car moving around a roundabout at a constant speed has a changing velocity. (Higher) [2]

Exam-style question

AQA style

7 Sound travels at 330 m/s in air. A student sees lightning and hears the thunder 3 s later.

a Calculate how far away the lightning was. [2]

b Explain why the student sees the lightning before hearing the thunder. [1]

c On an accelerating object's distance–time graph, describe how to find its speed at one particular time. (Higher) [2]

Total: _____ / 19

How confident am I?	Not yet	Nearly	Got it
I can use s = vt with correct units	☐	☐	☐
I can read speed from a distance–time graph	☐	☐	☐
I can explain the difference between speed and velocity	☐	☐	☐
